

Cybersecurity Web and Server - HTML Introduction

1. HTML basics part 1 —

This video consisted of installing XAMPP server and running apache and mysql server on it and then installed sublime text in order to write HTML and then hosted a basic infosec website on localhost.

2. HTML basics part 2

This video consisted of introduction to Anchor tag and href for creating a link between two web pages. The first page was link to a html form

3. Difference between static and dynamic website

The topic of the video was dynamic and static websites. A static website is one where each web page requires its own set of code. Although it requires web development knowledge, it is less expensive, simpler to build, and easier to host. Changes to static pages on the website take a long time. A website that is dynamic eliminates the need for you to write separate code for each page. In websites that are dynamic, the pages are updated dynamically. Various website sections are requested on the web page and are saved as templates. Dynamic pages are easier to update, maintain and add new content. But is expensive and slow to develop.
